# **Definitions**

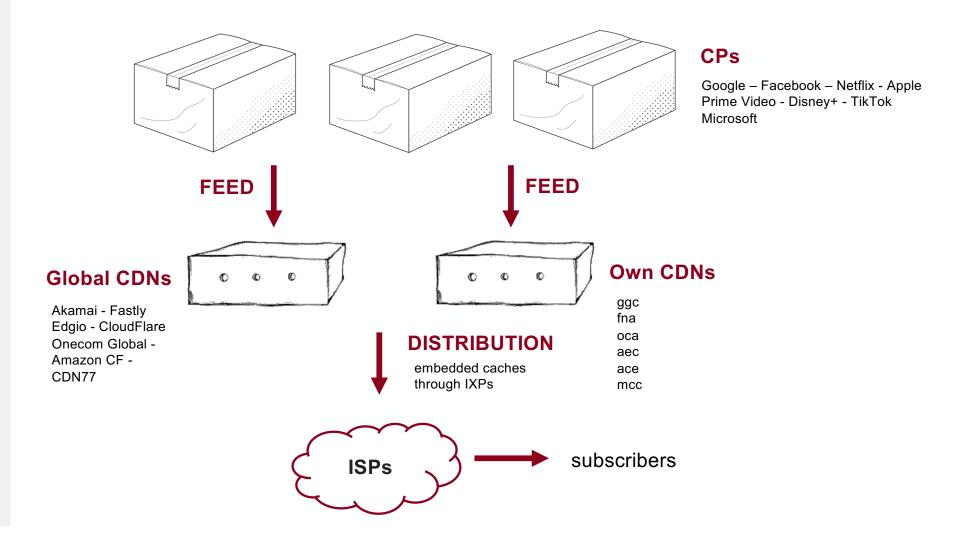

- An Internet Exchange Point (IXP) is a network facility that enables the interconnection of more than two
  independent Autonomous Systems (AS), primarily for the purpose of facilitating the exchange of Internet
  traffic
  - Born in the late 1990s early 2000s
  - Drive costs down, improve performances
  - https://www.internetexchangemap.com
- The Internet traffic data in this presentation refer (mostly) to Namex
  - public traffic passing through the peering platforms of the IXP is usually measured

# CDNs in-network caching in numbers

hypergiants that deploy servers inside other networks improve the fundamental challenges of the Internet — capacity, latency and congestion — and they reduce the amount of traffic traversing peering interconnections

over 3,500 ASNs globally have embedded servers
